Load Library Packages

1 - Analysis of AAPL

1.0 - Analysis Setup

Set up File name

```
file = "Data/AAPL_2023-03-26.csv"
```

Read the .CSV and select Date and Closing Price

```
Stock_information <- read.csv(file)

selected_stock_information <- Stock_information %>%
    select(c('Date','Close')) %>%
    mutate(row_value = row_number())
```

Collect Stock/ETF Ticker to be displayed on future visualizations to remove confusion

```
file_name = substring(file,6,9)
```

First set

```
selected_stock_information_tsibble <- as_tsibble(selected_stock_information, index = row_value)</pre>
```

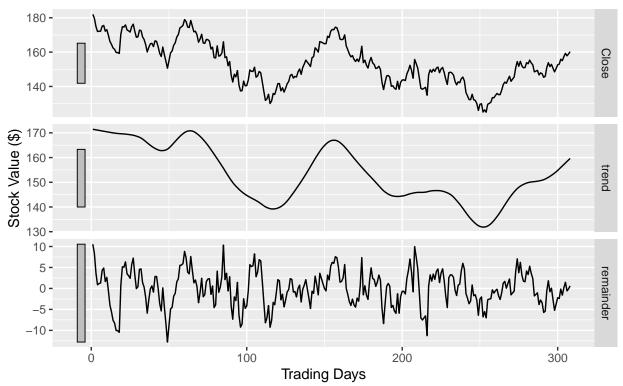

Set up for Monthly; second set. This could be useful in the future.

```
selected_stock_information_monthly <- yearmonth(selected_stock_information$`Date`, format = "%Y-%m-%d")
selected_stock_information$`Date` <- selected_stock_information_monthly
selected_stock_information_montly_tsibble <- as_tsibble(selected_stock_information, index = row_value)
selected_stock_information_montly_aggregated_tsibble <- selected_stock_information_montly_tsibble %>%
   aggregate(Close ~ Date, sum) %>%
   mutate(row_value = row_number()) %>%
   as_tsibble(index = row_value)
```

1.1 - Decomposition

AAPL STL decomoposition

Close = trend + remainder

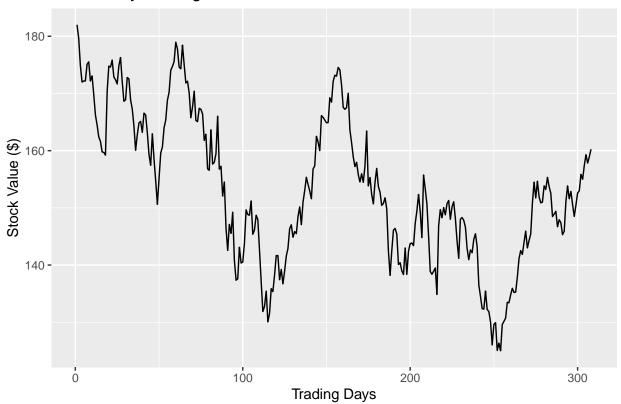

1.2 - Time Series Visualization (needs another visualization)

```
autoplot(selected_stock_information_tsibble) +
labs(y = "Stock Value ($)",
    title = paste(file_name, "Daily Closing Price over Time"),
    x = "Trading Days")
```

Plot variable not specified, automatically selected `.vars = Close`

AAPL Daily Closing Price over Time

Checking if the data is stationary. If kpss_stat > kpss_pvalue, then we reject null hypothesis and claim the data is non-stationary. Differencing will be required.

```
selected_stock_information_tsibble |>
  features(Close, unitroot_kpss)

## # A tibble: 1 x 2

## kpss_stat kpss_pvalue

## <dbl> <dbl>
## 1 2.13 0.01
```

Output is the number of differences make the data stationary

```
selected_stock_information_tsibble |>
features(Close, unitroot_ndiffs)
```

A tibble: 1 x 1

```
## ndiffs
## <int>
## 1 1
```

The difference

```
selected_stock_information_tsibble |>
  mutate(diff_close = difference(Close)) |>
  features(diff_close, unitroot_kpss)

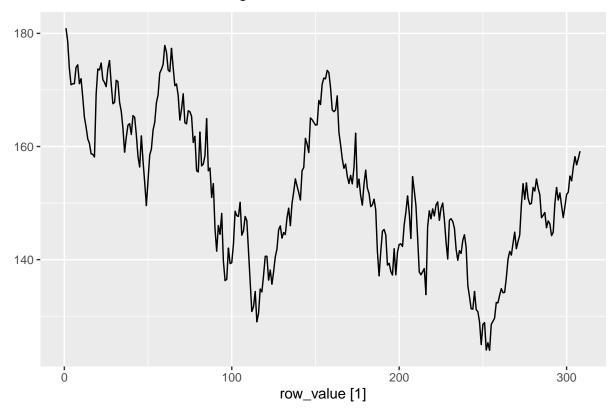

## # A tibble: 1 x 2

## kpss_stat kpss_pvalue

## <dbl> <dbl>
## 1 0.150 0.1
```

Using Box-Cox Transformation does not change the shape of the Closing Price with a lambda value of 1.

AAPL Transformed Closing Price with $\lambda = 1$

1.3 - Description of the Time Series:

INPUT SOMETHING

1.4 - TS Models (transformations)

 ${\bf Input~SOMETHING~like~differencing?}$

1.5 - Predictions

ARIMA approach

```
selected_stock_information_tsibble |>
  gg_tsdisplay(difference(Close), plot_type='partial')
## Warning: Removed 1 row containing missing values (`geom_line()`).

```

First Prediction using ARIMA

AAPL Daily Closing Price over Time

Second approach, first creating a Train set and a Test set

```
length_df = nrow(selected_stock_information_tsibble)
Train_number = round(length_df * 0.98, 0)

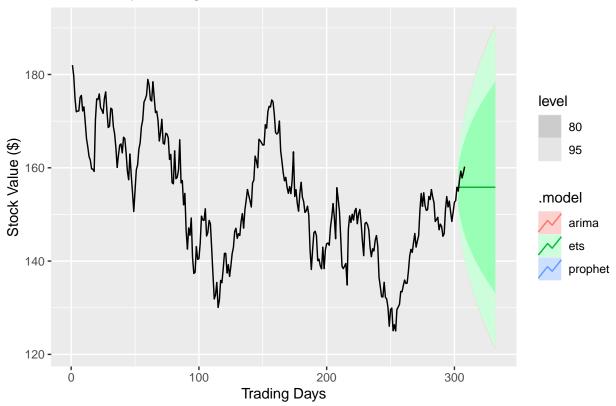

Train <- selected_stock_information_tsibble[0:Train_number,]
Test <- selected_stock_information_tsibble[Train_number:length_df,]</pre>
```

Period is set to twelve for the months, and order = 1 since data is non-seasonal

Warning: 1 error encountered for prophet
[1] 'origin' must be supplied

Prophet model is not good since there is no seasonality

2 - Analysis of MSFT

2.0 - Analysis Setup

Set up File name

```
file = "Data/MSFT_2023-03-26.csv"
```

Read the .CSV and select Date and Closing Price

```
Stock_information <- read.csv(file)
selected_stock_information <- Stock_information %>% select(c('Date','Close')) %>%
mutate(row_value = row_number())
```

Collect Stock/ETF Ticker to be displayed on future visualizations to remove confusion

```
file_name = substring(file,6,9)
```

First set

```
selected_stock_information_tsibble <- as_tsibble(selected_stock_information, index = row_value)</pre>
```

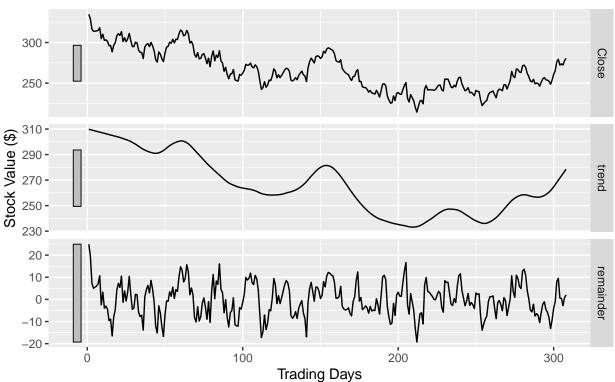

Set up for Monthly; second set. This could be useful in the future.

```
selected_stock_information_monthly <- yearmonth(selected_stock_information$`Date`, format = "%Y-%m-%d")
selected_stock_information$`Date` <- selected_stock_information_monthly
selected_stock_information_montly_tsibble <- as_tsibble(selected_stock_information, index = row_value)
selected_stock_information_montly_aggregated_tsibble <- selected_stock_information_montly_tsibble %>%
aggregate(Close ~ Date, sum) %>% mutate(row_value = row_number()) %>%
as_tsibble(index = row_value)
```

2.1 - Decomposition

MSFT STL decomoposition

Close = trend + remainder

2.2 - Time Series Visualization (needs another visualization)

```
autoplot(selected_stock_information_tsibble) +
labs(y = "Stock Value ($)",
    title = paste(file_name, "Daily Closing Price over Time"),
    x = "Trading Days")
```

Plot variable not specified, automatically selected `.vars = Close`

MSFT Daily Closing Price over Time

Checking if the data is stationary. If kpss_stat > kpss_pvalue, then we reject null hypothesis and claim the data is non-stationary. Differencing will be required.

```
selected_stock_information_tsibble |>
  features(Close, unitroot_kpss)

## # A tibble: 1 x 2

## kpss_stat kpss_pvalue

## <dbl> <dbl>
## 1 3.37 0.01
```

Output is the number of differences make the data stationary

```
selected_stock_information_tsibble |>
features(Close, unitroot_ndiffs)
```

```
## # A tibble: 1 x 1
```

```
## ndiffs
## <int>
## 1 1
```

The difference

```
selected_stock_information_tsibble |>
  mutate(diff_close = difference(Close)) |>
  features(diff_close, unitroot_kpss)

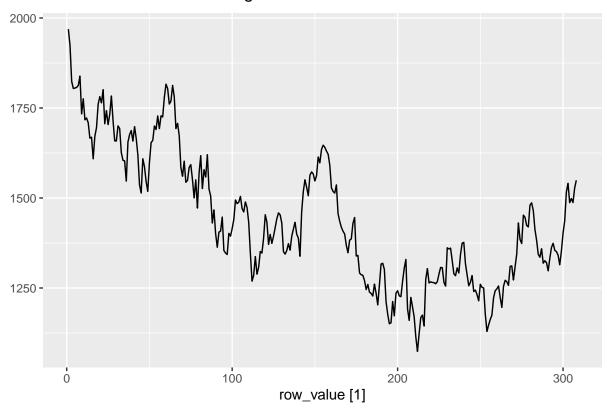

## # A tibble: 1 x 2

## kpss_stat kpss_pvalue

## <dbl> <dbl>
## 1 0.238 0.1
```

Using Box-Cox Transformation does not change the shape of the Closing Price with a lambda value of 1.

MSFT Transformed Closing Price with $\lambda = 1.36$

file_name = substring(file,6,9)
```

First set

```
selected_stock_information_tsibble <- as_tsibble(selected_stock_information, index = row_value)</pre>
```

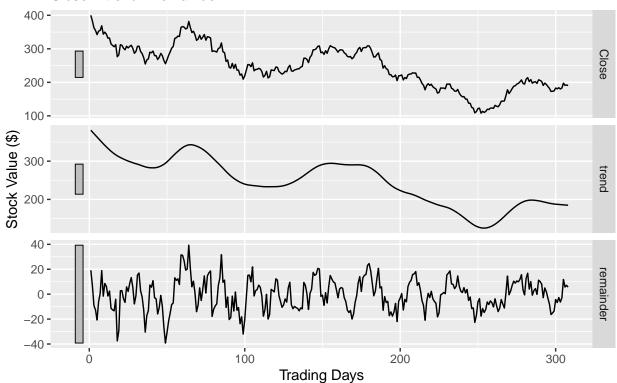

Set up for Monthly; second set. This could be useful in the future.

```
selected_stock_information_monthly <- yearmonth(selected_stock_information$`Date`, format = "%Y-%m-%d")
selected_stock_information$`Date` <- selected_stock_information_monthly
selected_stock_information_montly_tsibble <- as_tsibble(selected_stock_information, index = row_value)
selected_stock_information_montly_aggregated_tsibble <- selected_stock_information_montly_tsibble %>%
   aggregate(Close ~ Date, sum) %>%
   mutate(row_value = row_number()) %>%
   as_tsibble(index = row_value)
```

3.1 - Decomposition

TSLA STL decomoposition

Close = trend + remainder

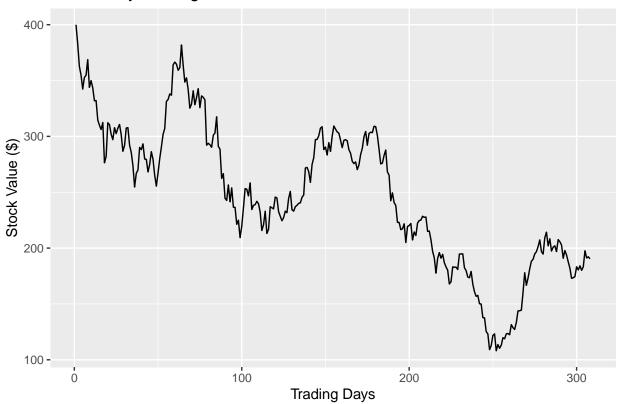

3.2 - Time Series Visualization (needs another visualization)

```
autoplot(selected_stock_information_tsibble) +
labs(y = "Stock Value ($)",
    title = paste(file_name, "Daily Closing Price over Time"),
    x = "Trading Days")
```

Plot variable not specified, automatically selected `.vars = Close`

TSLA Daily Closing Price over Time

Checking if the data is stationary. If kpss_stat > kpss_pvalue, then we reject null hypothesis and claim the data is non-stationary. Differencing will be required.

```
selected_stock_information_tsibble |>
  features(Close, unitroot_kpss)

## # A tibble: 1 x 2

## kpss_stat kpss_pvalue

## <dbl> <dbl>
## 1 3.58 0.01
```

Output is the number of differences make the data stationary

```
selected_stock_information_tsibble |>
features(Close, unitroot_ndiffs)
```

```
## # A tibble: 1 x 1
```

```
## ndiffs
## <int>
## 1 1
```

The difference

```
selected_stock_information_tsibble |>
  mutate(diff_close = difference(Close)) |>
  features(diff_close, unitroot_kpss)

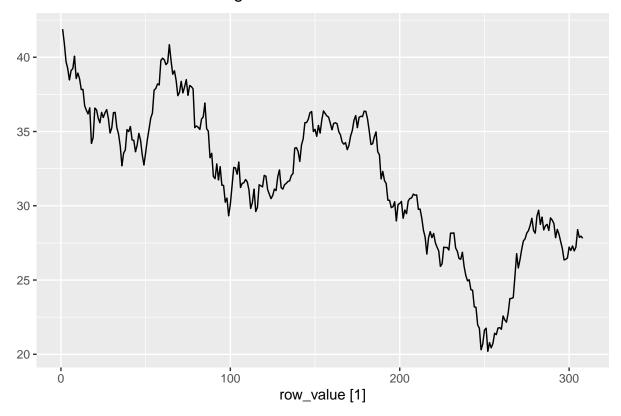

## # A tibble: 1 x 2

## kpss_stat kpss_pvalue

## <dbl> <dbl>
## 1 0.127 0.1
```

Using Box-Cox Transformation does not change the shape of the Closing Price with a lambda value of 1.

TSLA Transformed Closing Price with $\lambda = 0.52$

                                                                                             20
                                                                            10
                          lag [1]
                                                                              lag [1]
```

Generate a few ARIMA orders and then compare results.

```
## <lst_mdl[1]>
## [1] <ARIMA(0,1,5)>
```

glance(selected_stock_fit) |> arrange(AICc) |> select(.model:BIC) ## # A tibble: 6 x 6 ## .model sigma2 log_lik AIC AICc BIC <dbl> <dbl> <dbl> <dbl> ## <chr>> <dbl> -1143. 2297. 2298. 2320. ## 1 search 102. ## 2 arima010 105. -1150. 2301. 2301. 2305. 105. -1149. 2302. 2302. 2310. ## 3 arima110 ## 4 arima011 105. -1149. 2302. 2302. 2310.

Show the residuals using the 'search' ARIMA

105.

105.

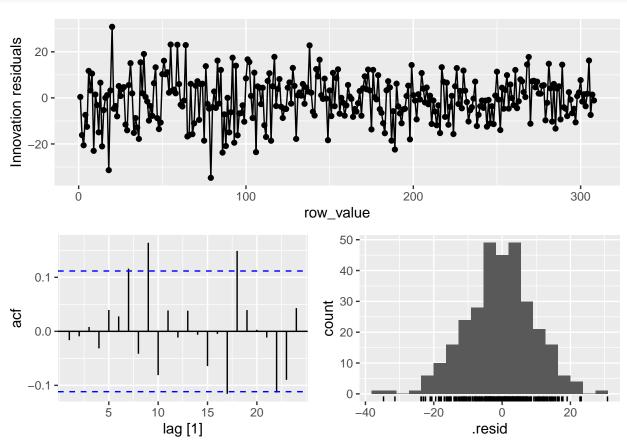

5 stepwise

6 arima111

-1149. 2304. 2304. 2315.

-1149. 2305. 2305. 2316.

```
selected_stock_fit |>
  select(search) |>
  gg_tsresiduals()
```

Portmanteau test shows a large P-value, suggesting the residuals are simliar to white noise

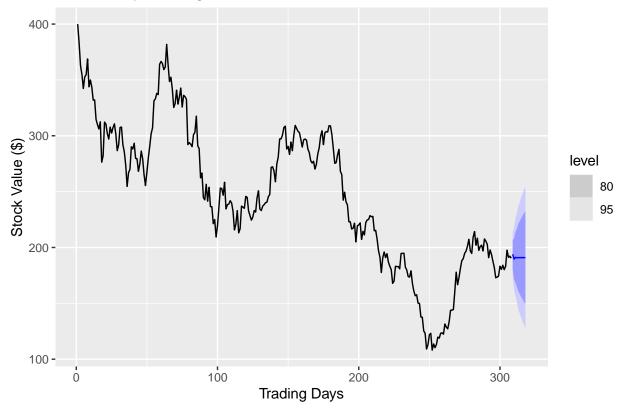

```
augment(selected_stock_fit) |>
filter(.model=='search') |>
features(.innov, ljung_box, lag = 10, dof = 3)
```

A tibble: 1 x 3

```
## .model lb_stat lb_pvalue
## <chr> <dbl> <dbl> <dbl>
## 1 search 16.7 0.0197
```

First Prediction using ARIMA

TSLA Daily Closing Price over Time

Second approach, first creating a Train set and a Test set

```
length_df = nrow(selected_stock_information_tsibble)
Train_number = round(length_df * 0.98, 0)

Train <- selected_stock_information_tsibble[0:Train_number,]
Test <- selected_stock_information_tsibble[Train_number:length_df,]</pre>
```

Period is set to twelve for the months, and order = 1 since data is non-seasonal

Warning: 1 error encountered for prophet
[1] 'origin' must be supplied

Prophet model is not good since there is no seasonality

Team contributions (pending...)

Brian: Completed rough draft of the Part 2 submission.

Mohan: Generated Github repo and place Datasets. Picked option 1.

Brendan: Picked option 1.
